SAFETY CHECK-OUT

(US Model only)

After correcting the original service problem, perform the following safety checks before relasing the set to the customer

- Check the area of your repair for unsoldered or poorly soldered connections Check the entire board surface for solder splashes and bridges.
- 2. Check the interboard wiring to ensure that no wires are "pinched" or contact high-wattage resistors.
- Check that all control knobs, shields, covers, ground straps, and mounting hardware have been replaced. Be absolutely certain that you have replaced all the insulators.
- 4 Look for unauthorized replacement parts, particularly transistors, that were installed during a previous repair Point them out to the customer and recommned their replacement
- 5 Look for parts which, though functioning, show obvious signs of deterioration Point them out to the customer and recommend their replacement
- Check the line cord for cracks and abrasion. Recommend the replacement of any such line cord to the customer
- Check the condition of the monopole antenna (if any).
 Make sure the end is not broken off and has the plastic cap on it.
 - Point out the danger of impalement on a broken antenna to the customer, and recommend the antenna's replacement.
- Check the B+ and HV to see they are at the values specified.Make sure your instruments are accurate; be suspicious of your HV meter if sets always have low HV
- Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage Check leakage as described below

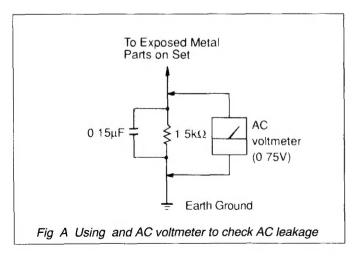

LEAKAGE TEST

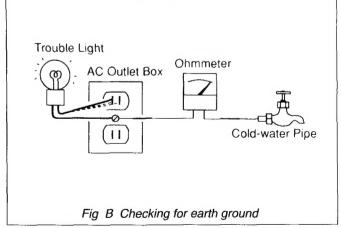

The AC leakage from any exposed metal parts to earth ground and from all exposed metal parts to any exposed metal parts having a return to chassis, must not exceed 0.5 mA(500 microampers) Leakage current can be measured by any one of three methods.

- A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers instructions to use these instruments
- A battery-operated AC milliammeter The Data Precision 245 digital multimeter is suitable for this job
- 3. Measuring the voltage drop across a resistory by means of a VOM or battery-operated AC voltmeter The "limit" indication is 0 75V, so analog meters must have an accurate low-voltage scale The Simpson 250 and Sanwa SH-63TRD are examples of a passive VOM that is suitable Nearly all battery operated digital multimeters that have a 2V AC range are suitable (See Fig. A)

HOW TO FIND A GOOD EARTH GROUND

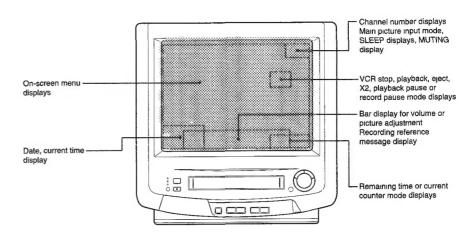

A cold-water pipe is guaranteed earth ground, the cover plate retaining screw on most AC outlet boxes is also at earth ground If the retaining screw is to be used as your earth ground, verify that it is at ground by measuring the resistance between it and a coldwater pipe with an ohmmeter. The reading should be zero ohms. If a cold-water pipe is not accessible The reading should be zero ohms. If a cold-water pipe is not accessible, connect a 60-100 watts trouble light (not a neon lamp) between the hot side of the line, the lamp shojuld light at normal brilliance if the screw is a ground potential (See Fig. B)

Protecting your cassette against accidental erasure

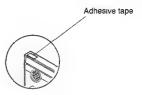

The cassette is provided with a safety tab to protect against accidental recording. Break off the safety tab with a screwdriver or other suitable tool.

If the safety tab is removed, the cassette will be ejected when you try to record on the cassette.

RM-Y138/W

To record on a cassette with the safety tab broken off, simply cover the tab hole with adhesive tape.

Maximum recording time of a tape

The quality of tape you use greatly affects record/playback quality and the life of the VIDEO TV. Use only cassette tapes that have the official VHS logo.

High-grade tapes give the best results, especially at the EP speed. They also have a better oxide coating that helps prevent dirty video heads. Although T-160 tapes offer the longest recording time, they contain thinner tape that is more likely to stretch or cause tape jams. We suggest that you use T-120 or shorter tapes.

Recording in the SP or EP mode is possible with this unit. When recording, select the desired recording mode (SP or EP) with TAPE SPEED on the Commander. During playback, the unit automatically detects the recording format, and then plays back the tape in the appropriate mode.

The following chart shows the maximum recording times for T-60, T-120 and T-160 tapes at the recording speeds as below.

Speed	T-60	T-120	T-160
SP	1 Hour	2 Hours	2 2/3 Hours
	(60 Minutes)	(120 Minutes)	(160 Minutes)
EP	3 Hours	6 Hours	8 Hours
	(180 Minutes)	(360 Minutes)	(480 Minutes)

Playing back a video tape in the LP mode is possible but recording in this mode is not possible with this unit.

Playing Back a Tape Recorded on Another VCR

When playing back a tape recorded on another VCR, there might be some picture noise.

Tracking ensures that the tape is correctly aligned with the playback head. It only works in the "playback" mode and its principle purpose is to minimize picture shake and what is called "noise" (fuzzy lines across the picture during playback and still picture).

It is adjusted either automatically or manually.

Automatic tracking adjustment function

When playback starts, the auto tracking automatically adjusts the picture. "AUTO TRACKING" flashes for 5 seconds.

The automatic tracking control is activated in the following conditions:

- . When the cassette is inserted for the first time.
- When the recording mode on the playback tape is switched from SP to EP and back again.
- . When the picture is distorted by scratches on the tape.
- When TRACKING AUTO:ON is selected in the Tracking menu after the picture is adjusted automatically.

If auto tracking does not work, the tracking was probably last adjusted manually.

Adjusting the tracking manually during playback

When the playback picture proves to have streaks or snow during normal playback, Still picture or Slow picture, adjust the picture manually using the Tracking menu. Press either \triangle + or ∇ - to select TRACKING ADJUST in Tracking menu to obtain the best possible picture. Press RETURN and adjust by pressing \triangle + or ∇ - When playing back a tape recorded on another VCR, the tracking condition is automatically adjusted on this VCR.

Notes

- Auto tracking adjustment may be impossible when the recording condition of the tape is poor.
- During auto tracking adjustment, streaks or noise may appear.

RECORDING TV PROGRAMS USING VCR PLUS +

VCR Plus+ is a feature in SONY VCRs that simplifies the task of programming the VIDEO TV to make timer recordings.

How VCR Plus+ works

Whenever you want to record a TV program, all you need to do is look up the program's "PlusCode,"

number assigned to each program that's published in the TV section of most newspapers, cable TV listings, and even TV GUIDE magagine. Then, just enter the PlusCode of the program you want and the VIDEO TV is automatically programmed to record that show. It's that simple. With VCR Plus+, you no longer have to go through a lengthy and often repetitive procedure when you set start and stop times, channel numbers, and dates. All this information is automatically sent to your VIDEO TV when you enter the program's PlusCode.

Setting Up VCR Plus +

Setting up your VIDEO TV involves coordinating the TV channel number(the number you turn to on your set to watch a program) with the guide channel number (the number that's assigned to that channel in your program guide). To get the guide channel numbers, find the "Channel Line-up Chart" in the program guide for your area that features VCR PlusCodes. It usually looks like the example on page 45.

For each channel your VIDEO TV receives, use the Channel Line-up Chart to check that the channel numbers match. For example, if HBO is listed in the Channel Lineup Chart on channel 33, and your VIDEO TV receives HBO on channel 15, you need to coordinate these numbers using the following procedure. For channels in which the numbers are the same (for example, if your VIDEO TV recevies HBO on channel 33, and the guide channel number is 33), you can skip this procedure.

In main menu, press △+ or ▽- to select SET VCR Plus+ CHANNELS.

- As soon as shorting C1311, the receiver stops operating.
   And removing the external short, the receiver operates normally.

#### 4-3. HOLD-DOWN CHECK

This procedure should always be performed when replacing the following components (marked with \_i on the Schematic Diagram).; IC1501, ZD1402, T1402, DY

#### 1) Circuit Diagram

#### 2) Circuit operating explanation.

## Normal condition

DC voltage appears at point X from FBT pulse by rectifying circuit consisted of FR1417, D1403, and C1428. DC voltage of point Y is divided into R1428, R1427, R1418 from DC voltage of point A.

In normal condition, DC voltage of point Y is lower than 6 volt.

So the set is operated normally.

#### Abnormal Condition

In abnormal condition, DC voltage of point X increase in proportion up to ? volt.

Therefore, the hold down circuit is operated.

In result, the horizontal frequency is stopped.

#### 3) Check the X-Ray protection circuit.

- a. Turn on the set and connect the color bar signal at the antenna terminal.
- b. Check the B+ voltage whether it is correct or not.
- c. If B+ is incorrect, power circuit is to be repaired.
- d. To check the operation of hold down circuit, short points X and Y.
- e. Identify the screen status whether raster is appeared or not.

- f. If there is distorted synchronism of screen, the set is OK.
- g. Remove the shorted jumper from points X and Y.

#### 4) Troubleshooting the Hold-Down circuit.

Shorting points Xand Y. check the voltage of point Y.

- If the voltage is below 6V DC, check ZD1404, C1428, L1406, R1419, FR1417, and D1403 and replace defective one.
- If the voltage is over 6V DC, C1405, R1405, IC1501 and replace defective one.

Fig. C-6-2

3) Load a blank tape and set the VCR to the play

- 4) Confirm that the tape runs fittingly to the lower limit of the P4 post. Also confirm that the tape runs smoothly.
- 5) If adjustment is required, turn Cone Point Screw clockwise until curling is apparent at the lower edge of P4. Then turn Cone Point Screw counterclockwise until the curling smooths out.

6) Check that there is no conspicuous curling and folding around the A/C head. If there is conspicuous curling or folding, readjust the Cone Point Screw, Azimuth Adjustment Screw and A/C Head Adjuster. When the bottom edge of tape is 0.20~0.25mm from the bottom edge of the control head's core, the height of A/C head is ideal.

### 10-12. MAINTENANCE/INSPECTION PROCEDURE

### (1) Required Maintenance

The recording density of a VCR is much higher than that of an audio tape recorder. VCR components must be very precise, at tolerances of 1/1000mm, to ensure compatibility with other VCRs. If any of these components are worn or dirty, the symptoms will be the same as if the part is defective. To ensure good picture, periodic inspection and maintenance, including replacement of worn out parts and lubrication, are necessary

### (2) Scheduled Maintenance

Schedules for maintenance and inspection are not fixed because they vary greatly according to the way in which the customer uses the VCR, and the environment in which the VCR is used

But, in general home use, a good picture will be maintained if the inspection and maintenance is made every 1,000hours. The table below shows the relation between time used and inspection period.

Table 1

| When inspection is necessary     | About 1<br>year | About 18 months | About 3 years |
|----------------------------------|-----------------|-----------------|---------------|
| Average<br>hours used<br>per day |                 |                 |               |

| Two hours                        | //////          |                 |               |

### (3) Check before starting repairs

The following faults can be remedied by cleaning and oiling. Check the needed lubrication and the conditions of cleanliness in the unit

Check with the customer to find out how often the unit is used, and then determine that the unit is ready for in spection and maintenance. Check the following parts

Table 2

### (4) Supplies Required for Inspection and Maintenance

- (1) Greases Kanto G-31(or equivalent)
- (2) Alcohol(Isopropyl Alcohol)
- (3) Cleaning Patches

#### 5) Maintenance Procedure

### 5-1) Cleaning

(1) Cleaning video head

First use a cleaning tape If dirt on head is too stubborn to remove by tape, use the cleaning patch Coat the cleaning patch with alcohol(Isopropyl Alcohol) to the point indicated. Touch the cleaning patch to the head tip and gently turn the head(rotating cylinder) right and left.

(Do not move the cleaning patch vertically and make sure that only the buckskin on the cleaning patch comes into contact with the head. Otherwise, the head may be damaged)

Thoroughly dry the head. Then run test tape. If alcohol (Isopropyl Alcohol) remains on the video head, the tape may be damaged when it comes into contact with the head surface.

(2) Clean the tape transport system and drive system, etc, by wiping with a cleaning patch wetted with alcohol (Isopropyl Alcohol).

#### Note:

- ① It is the tape transport system which comes into contact with the running tape. The drive system consists of those parts which move the tape.
- ② Make sure that during cleaning you do not touch the tape transport system with the tip of a screw driver and no force is applied to the system that would cause deforming

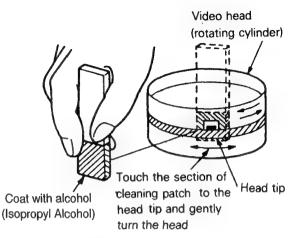

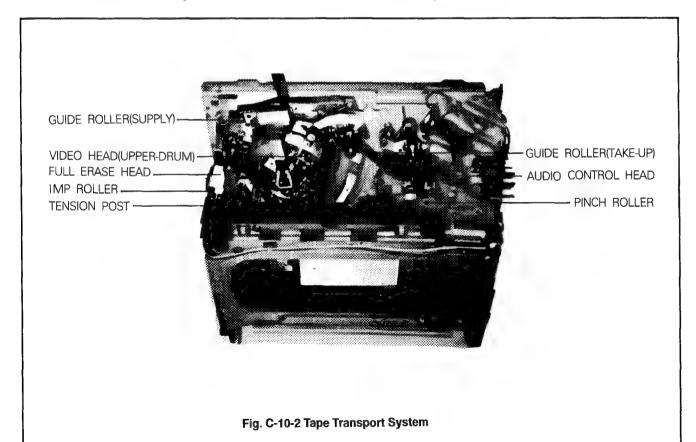

Fig. C-10-1

### 5-2) Greasing

(1) Greasing guidelines

Apply grease, with a cleaning patch. Do not use excess grease. It may come into contact with the tape transport of drive system. Wipe any excess and clean with cleaning patch wetted in alcohol(Isopropyl Alcohol).
